Maximum Marks	4 Marks

Data Flow Diagram

A Data Flow Diagram (DFD) represents how information moves through the proposed school IT helpdesk system. It shows how a student or teacher submits an incident request, how Flow Designer analyzes keywords in the short description and description fields, how the ticket is automatically classified, and how the appropriate IT support team processes the incident and updates its status.

Level-0 Data Flow Diagram (Project Specific)

Key flow: Student/Teacher incident request, Flow Designer keyword analysis, automatic ticket classification, appropriate IT support team, incident processing / status update.

User Stories

The following user stories describe the main functional requirements of the IT helpdesk ticket-classification automation project.

User Type	Functional Requirement (Epic)	User Story ID	User Story / Task	Acceptance Criteria	Priority	Release
Student / Teacher	Incident Ticket Submission	USN-1	As a student or teacher, I can submit an IT incident with a short description and description so that the issue can enter the automated classification workflow.	I can submit a valid incident and receive a confirmation/status update.	High	Sprint-1
Student / Teacher	Ticket Classification Status	USN-2	As a student or teacher, I can view the category assigned to my incident so that I know how my issue has been classified.	The assigned category is visible after the classification flow runs.	High	Sprint-1
Student / Teacher	Incident Tracking	USN-3	As a student or teacher, I can receive workflow notifications when my incident is classified or routed so that I do not need repeated manual follow-up.	Notification is generated when the incident moves to the next workflow stage.	Medium	Sprint-2
IT Support	Automated Classification Workflow	USN-4	As IT support, I can use Flow Designer to analyze keywords and classify incoming incidents so that tickets are processed consistently.	Matching keywords automatically assign the appropriate incident category; unmatched incidents are handled for manual review.	High	Sprint-1
IT Support	Incident Management	USN-5	As IT support, I can view incident details and update the processing status so that the requester has clear visibility.	Incident details and status can be updated and tracked.	High	Sprint-1
IT Support	Category-Based Routing	USN-6	As IT support, I can route classified incidents to the appropriate support team so that the correct team can process the issue.	Classified incidents are assigned to the appropriate support category/team.	High	Sprint-2
IT Support	Incident Status Update	USN-7	As IT support, I can update the incident status so that students, teachers, and support staff can track progress.	Status changes are stored against the correct incident.	Medium	Sprint-2
IT Support	Reporting	USN-8	As IT support, I can view incident and classification records so that repeated manual work and classification errors are reduced.	Relevant incident records can be reviewed with their latest category and status.	Low	Sprint-3

Project Goal: Automate school IT incident classification using Flow Designer by analyzing keywords in the short description and description fields to reduce repetitive manual work, improve classification consistency, route tickets appropriately, and provide clear incident status visibility.
